

[old way] Scoping problem with strict mode

```
-----  
file1.js  
"use strict";  
let doSomething = function() {  
    // strict mode applies  
}
```

```
-----  
file2.js  
let doSomethingElse = function() {  
    // strict mode applies too  
}
```

[old way] Encapsulate Javascript in **a closure**

```
(function() {  
    "use strict";  
  
    let private = function() {  
        // private is not available from outside  
    }  
} ());
```
