

Fetch (new)

```
fetch(url, {  
  method: method  
  body: body  
}).then(function(res) {  
  if (res.status !== 200) throw new Error(res.status);  
  return res.text();  
}).then(function(text) {  
  console.log(text);  
}).catch(function(error) {  
  console.log(error);  
})
```

Concurrency issue - a typical example

```
let result = ""
fetch(url)
  .then(function(response) {
    return response.text();
  }).then(function(res) {
    result = res;
  })
document.getElementById.innerHTML = result;
```
